Mods won't work in normal Minecraft, so we need a special version designed for modding. Go to the Minecraft Forge website and download the version of Forge that is compatible with your chosen mods. If the mod you have is for Forge version 1.15.2, download Forge version 1.15.2. If you're in Chrome, it can say Forge is a virus. However, feel free to ignore that. Simply click on the Java file once it has been downloaded and install it. 2. Using different versions of ForgeSi, for example, the chosen mod is for version 1.12, you will need to manually add it to Minecraft after downloading and installing it. To do this, open the Minecraft launcher and click Installations. Then click new and there should be a drop-down box, which once clicked, displays not only all previous iterations other than Minecraft, but also their versions of Forge that you have downloaded. Click the Forge you want and save it, then the launcher will download the corresponding version. Then it is just a case of returning to the main screen with 'play' on, and on the left there is another drop-down box where you can select the version of Forge you want to play. 3. Find your MinecraftCarcar Minecraft mod folder as you normally would. Once you reach the main screen of the title, the one in which you create a new world or play with options, there should be an option marked as 'mods'. Click on that. Then look for where it says 'open mods folder'. You can access this through Windows Explorer, but our path is much, much easier. 4. OK, this is not as much a step as a general Be very, very careful who you get your Minecraft mods from. Although there are several trusted sites out there, all it takes is a bad egg to load a mod with some kind of virus attached. The best way to check if something is safe is by reading the comments or taking a look at the videos on YouTube uploaded from someone who is not the creator of the mod. It's also worth checking how well-known the creator is. Do you have a lot of followers who will answer for them? Would a virus ruin your Minecraft career? Always think before pressing download. No mod is worth wreaking havoc on your CPU because some clown wants to mine Bitcoin. Editors' recommendations If you've played Minecraft, then it's easy to see how fun it is Maybe. Running your own server allows you to take all your friends to the same game, and you can play with the rules you can make or break. It's the ultimate in an addictive game! We've already shown you how to get started with Minecraft, a Geeks Love game. What's better than a single player? Multiplayer, of course! You can join one of hundreds of servers on minecraftservers.net to get started, or search around it for more exclusive ones, but you are ultimately bound by its rules and discretion. Running your own server allows you and your friends to play along with your own set of rules, and it's very easy to do. Download and First Run Head on the Minecraft download page and go to the Multiplater Beta Server Software section. Windows users can only download the file .exe run it. OS X and Linux users must download the .jar file and then run the server using the following command in Terminal: java -Xmx1024M -Xms1024M -jar minecraft_server.jar nogui If you want to dedicate more (or less) RAM to your server, change the 1024M to something else, such as 2048M. The first number is the maximum amount you can use, and the second number is the minimum. Since everything is in Java, you must have at least one spare RAM concert to dedicate to Minecraft. Things can become rebellious with a decent number of people playing, especially when you start doing crazy things like blowing up huge caverns with huge amounts of TNT. In the server window, you will see the memory usage and processor thread on the left, the list of connected players at the bottom left, and the log and chat window on the right side. The first time you run the server, you will get some errors at first. That's normal, so don't panic! The server did not find the configuration files it needs, so it will. You will see some new files in the same folder as the server. There is the World folder, which contains the generated map area, a list of operations, and a server.properties file, among other things. Once the world has finished generating, you will receive a small notice about the help file. Close the server, or if you are running it in Terminal, simply type stop (without the quotation marks). Let's adjust and we can't do that while the server is running. Setting Server Properties Open the server.properties file in your notebook. You'll see something like this: You'll see some important options. level-name: This is the name of your Minecraft world. If you change this name, the server will search for a folder with a matching name, and if none is found, generate a new level with this name. Reappearance monsters: If set to false, monsters like zombies, skeletons and creepers will not appear. Often disabled for op or creative servers, everyone builds and survival is not the focus of gameplay. Spawning animals: If set to false, animals such as wolves, cows, sheep and chickens will not spawn. pvp: If set to false, players will not be able to harm each other, although you can still pushing other players off the ledges. Whitelist: If set to true, the server will only allow user names in the white-list.txt file to connect and play correctly. For a complete description of all the options, check out the Minecraft Wiki page at server.properties. Once you're done changing things to what you want, save the file. Since it's your server, be sure to add your Minecraft username in the ops.txt. This way, you'll be an operator with full administrator rights. You can generate any item you want, ban players, trade other players, and change game time. For your friends to connect to your server, you'll need to set up port forwarding on your router. The default port is 25565, but can be changed in the server.properties file. Your friends will need your IP address (or DNS alias/redirect) and this port number for them to connect. When you are ready, restart the server. Playing on a server When you start Minecraft, you are given the option to connect to a multiplayer server. Clicking on it will allow you to enter your address information. If you're playing on the same computer as your server, you can type localhost (without the quotes). Otherwise, connect the IP address or domain name of the server. Click Connect and you will join the server. Press T to open the chat console. You'll see all users' public messages, system messages, and commands that you've run. Note the small prompt (>) in the lower left corner. Typing something and pressing Enter will send a message to all other players in a group chat. You can also run commands here, and they always start with a forward slash (/). As an operation, you should be able to type /list and press Enter to list all connected players. You can also give items to any player (including yourself), prohibit and forgive specific users, and change the system time. If you are not sure of the requirements of a specific command, you can type /help for more information. For the full list of server commands, check out the Minecraft Wiki Server Commands page. Now go and tell all your friends to join! There is nothing to improve the construction of massive structures, the exploration of the vast landscape and mining in moutains, except to do so with 8 of his best friends. Friends.
